

Globally Responsible Careers {S4S week 2019 competition}

Everyone has a dream job they aspire to do in life. My dream job would be an environmental scientist as they conduct research to identify and try their best to eradicate pollution. I would endeavour to propose strategies to prevent environmental issues as well by trying to conserve essential energy. My findings would be submitted as data and specimens would be presented to organizations who are willing to endeavour to make the world a better place for the future generations.

This job would leave an immense impact on the Earth as mankind are annihilating the world that we live on. God created this world for mankind to reside on it, and it is our job with the technology that has evolved over the years to protect the natural resources that God gifted to us. Already, sabre-tooth cats and woolly mammoths are extinct, which is sufficient evidence that we haven't looked after precious animals properly. Environmental scientists are essential as they monitor the levels of pollution that we use during our daily life. They also assess the stability of the environment we live in. These people nurture the desire to have a world where everything is used correctly and there would be no fly-tipping anywhere. We need to stop throwing things in the sea and stop dumping our rubbish into landfill areas. This could affect the whole environment and could eventually make the whole world extinct.

The three major problems that environmental scientists need to find a resolution are global warming, pollution and how we humans dispose of our waste. Global warming affects animals and their adapted environments. It lethargically destroys the places animals need to survive in the world. Pollution is something that contaminates the natural environment. It can be in chemicals, noise and even in light. Waste disposal is how we dispose of our garbage. We dispose of our garbage in landfill areas. It can stay there for millions of years to come. We need to prevent these three main issues from transpiring.

I would help to make this job more globally responsible by designing encouraging posters around the area where we live to encourage young people to pursue careers in the field of environmental science. I would give a speech to children in schools across Brent to research environmental science. As well as this, I would tell children to stop make landfill even worse in certain areas and to stop throwing garbage in the sea. All of us are eventually going to be responsible for the extinction of sea-life. We do not want that to happen, even in the future generations.
